

The core topics

2) One Health

The interaction of human, animal and environmental health challenges plays a pivotal role in many communicable and non-communicable global health issues. We want to explore communicable health topics in this context, including neglected zoonotic diseases, (re)emerging infectious diseases, global health preparedness, vector control, antimicrobial resistance, and other cross-sectoral health challenges. We encourage scientific groups to address the complexity of One Health, including interdependency of biomedicine, public health, social sciences, epidemiology, environmental health and health economics. Does the One Health agenda depend on integrated health systems?
